

CLAIMS

1. A radio receiving apparatus comprising:

a despreader that performs first despread-
processing respectively with despread-
5 corresponding to a plurality of communication partners
for an identical received signal held temporarily, and
performs second despread-
despread-
code corresponding to a single communication
partner for a continuously received signal;

10 a switch that switches between the first
despread-
processing and the second despread-
processing according to a communication state; and

an assigner that performs finger assignment
according to a delay profile created using signals after
15 despread-
processing.

7. A communication terminal apparatus provided with a
radio receiving apparatus, said radio receiving

20040101 013000

apparatus comprising:

5 a despreader that performs first despread-
processing respectively with despread-
corresponding to a plurality of communication partners
for an identical received signal held temporarily, and
performs second despread-
despreading code corresponding to a single communication
partner for a continuously received signal;

10 a switch that switches between the first
despreading processing and the second despreading
processing according to a communication state; and

an assigner that performs finger assignment
according to a delay profile created using signals after
despreading processing.

9. A base station apparatus provided with a radio
receiving apparatus, said radio receiving apparatus
20 comprising:

25 a despreader that performs first despread-
processing respectively with despread-
corresponding to a plurality of communication partners
for an identical received signal held temporarily, and
performs second despread-
despreading code corresponding to a single communication
partner for a continuously received signal;

a switch that switches between the first

20048218 013002

despreading processing and the second despreading processing according to a communication state; and

an assigner that performs finger assignment according to a delay profile created using signals after
5 despreading processing.

10. (deleted)

11. A radio receiving method comprising:

10 a despreading step of performing first despreading processing respectively with despreading codes corresponding to a plurality of communication partners for an identical received signal held temporarily, and performs second despreading processing with a
15 despreading code corresponding to a single communication partner for a continuously received signal;

a switching step of switching between the first despreading processing and the second despreading processing according to a communication state; and

20 an assigning step of performing finger assignment according to a delay profile created using signals after despreading processing.
